

WAND-STYLE FAUCET INSTALLATION

1. Lay out the inline diverter valve and adapters within easy reach.
2. Pull out the wand and unscrew the hose connection from it's base. Make sure the hose does not recoil back into the main faucet.
3. Insert the inline diverter between the hose and the wand. If you have a smaller connection, use the included $\frac{3}{8}$ " adapters.

4. Remove the compression nut from the FLO+ tubing connection and insert the tubing through this nut.

5. Connect the FLO+'s tubing to the diverter seating it fully over the stem. Then tighten the compression nut.

WARRANTY AND RETURNS

Your Vitev FLO+ comes with a 3-year limited warranty for parts and labor (filters excluded) under normal use.

Should there be a warranty issue, just let us know and we'll take care of it.

All systems purchased directly from www.vitev.com come with a 30-day risk free trial which starts when the system arrives at your home.

If you choose to return your system, you will be responsible for the return shipping costs. We are not responsible for damages to units while in transit for return.

Please hold on to the packaging and accessories during the trial period as returns must be received in "as new" condition.

If you purchased your system from a retailer (anywhere other than www.vitev.com), please refer to their return policy and coordinate with the vendor.

WE KNOW WATER.

FLO+

USER GUIDE

INSTALLATION

- 1 Disconnect the aerator from your faucet

- 2 Replace with the included diverter valve*. It may be easier to remove the tube before twisting the adapter on. Just twist the connecting nut and slide it down the tube towards the FLO+, then disconnect the tube. After valve is tight, reconnect the tube, slide the nut back onto the stem and tighten again.

*You may need to use one of the included adapters to get the correct fit.

- 3 Run the tubing along and behind the faucet and then position the FLO+ on your counter. Turn the drinking rod as needed.

- 4 Turn on the faucet and pull the knob on the diverter valve to send the water to the FLO+

- 5 Let the water run for a few minutes until its clear, then stop and let it rest.

Wait a few minutes and run again for 10-15 seconds.

- 6 If the glass has any sediment, let it run a little longer to flush any residual mineral dust and/or carbon.

TIPTOE INTO THE WATER

The best way to incorporate Vitev water is to ease into it. Unless you've been consuming a lot of alkaline water previously, we suggest giving yourself a few days to adjust. It's very common to develop a craving as your cells wake up to true hydration; we just don't want you to overdo it.

So start with a couple glasses through the first day, especially if you don't normally drink much water. Gradually increase until you are at least drinking ½ of your weight a day in ounces. So if you're 150 pounds, shoot for 75 ounces. If you work out, or live in a dry climate, add a little extra.

Vitev water should be used for any drinking* or cooking application. Soups, teas, nutritional shakes, coffee, homebrews, etc are all better when you use better water.

When used correctly, the benefits of Vitev water are wide ranging. Some notice differences very quickly, while others take some time; we're all unique. Whatever you feel, we'd love to hear from you.

*The only exception is medication. Take pharmaceuticals with tap or bottled water so as not to affect the normal delivery process.

FREQUENTLY ASKED QUESTIONS

What's the best way to test the water?

pH testing (aka reagent) drops are the easiest and most cost effective. A couple drops into a sample of water will immediately turn the water a color representing a specific pH level. DO NOT USE STRIPS as they do not perform well with alkaline water.

Can I give this water to children?

Absolutely...in fact, watch how kids are drawn to the water. Ask them how they like it.

How long will the water stay "good"?

Naturally created alkaline water is very stable. It's always best to drink it as fresh as possible, but you'll also find a sustained shelf life. Filling a thermos or bottle and taking it to work, the gym or a couple bottles for the trip out of town is highly encouraged.

Is it OK to heat (or chill) the water?

Yes. There will be some minor change in pH, but that is more due to extended contact with the air than the temperature changes.

When do I know when to change the filter?

With average use (about 2 gallons per day) and when following suggested maintenance (scrubbing the ceramic monthly) you will need to replace both cartridges annually. You'll notice very quickly that Vitev water goes down easier than tap or bottled. These characteristics will go away as the filter is used up as will the pH level which you can check with pH testing drops. Lastly, the filter will stop eliminating pollutants in the water and you'll notice flavors return that were not there will the filter was fully functioning.

HOW TO CHANGE THE FILTER

- 1 Remove the drinking spout by pulling up on it

- 2 Use the wrench that came with the FLO++ and turn the housing covers counterclockwise. There will be water inside of the housing as well as the base, so be careful removing the housings.

- 3 Remove and dispose of both used cartridges. The new ceramic filter can be installed in any direction, the new Mineral cartridge is easier to place the end with the rubber gasket seal on the bottom.

- 4 Make sure the rubber ring gaskets are seated correctly in the track inside the housing, then twist the housings back on. Reinsert the drinking spout.

- 5 Flush like you did when it was brand new until the water runs clear and tastes wonderful
